Rappel sur l'observabilité

Rappel sur les 3 piliers de l'observabilité

L'**observabilité** est la capacité de mesurer l'état courant d'un système à partir des données qu'il produit qui peuvent être de différentes natures comme les **logs**, les **métriques** et les **traces**.

Logs

Il s'agit d'enregistrements datés et produits par une application afin de fournir des éléments contextuels permettant d'investiguer en cas d'incident

Métriques

Représentation numérique de données mesurées dans un interval de temps

Traces

Représentation de la relation causal entre plusieurs événements dans un système distribué

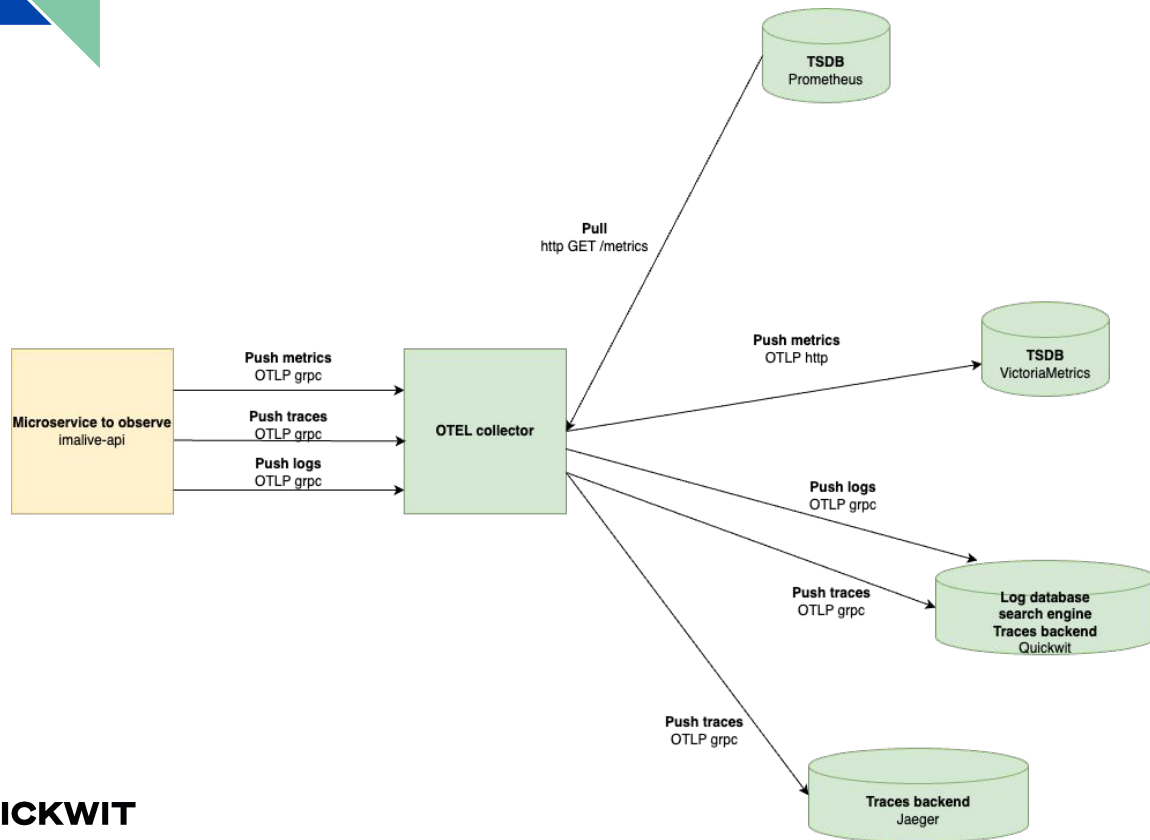

Observability landscape

Classement des outils d'observabilité les plus célèbres

Qu'est-ce qu'OpenTelemetry ?

Un standard d'observabilité interopérable pour les logs, traces et métriques

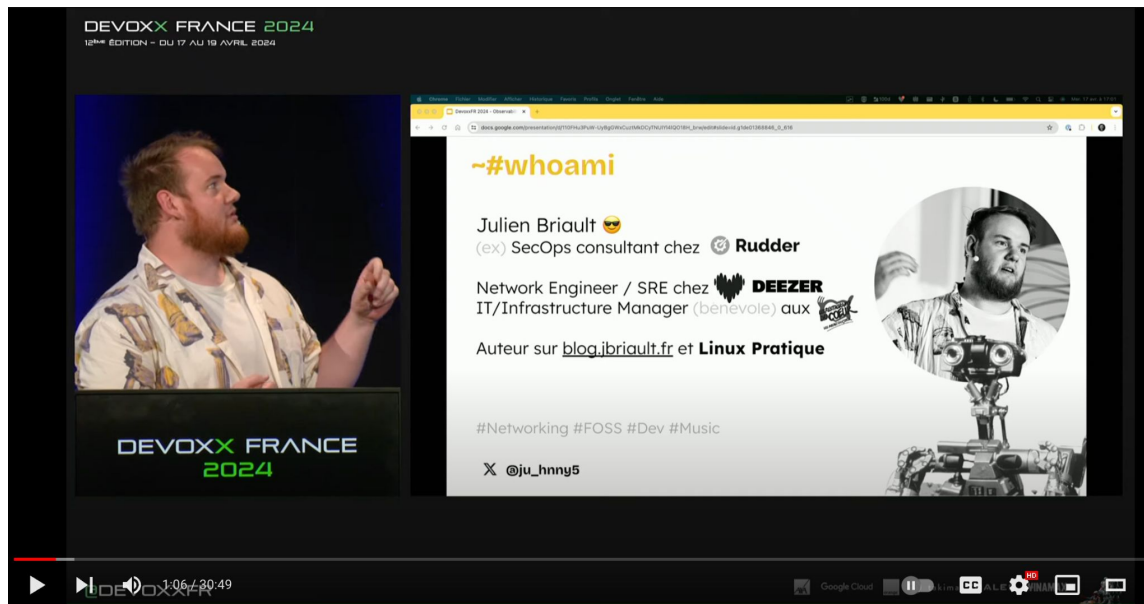

Site web : opentelemetry.io

Qu'est-ce que VictoriaMetrics ?

Petite parenthèse pour aller voir le talk de Julien

Talk de Julien "Observabilité :
dépoussiérer Prometheus
avec VictoriaMetrics":
youtu.be/bzLfWjUj2k0

Qu'est-ce que Quickwit ?

Solution de moteur de recherche concurrente à Elasticsearch, OpenSearch et Grafana Loki

Un peu le meilleur des deux mondes réunis

Site web : quickwit.io

Pourquoi choisir Quickwit ?

Les raisons de notre choix de cette solution

Quickwit, the next generation of modern observability

September 4, 2024 - 6 min read

Idriss Neumann
CEO comwork.io

In this blog post, I'll try to explain why we moved from [ElasticStack](#) to [Quickwit](#) and [Grafana](#) and why we choosed it over other solutions.

First, we've been in the observability world for quite some time and have been using ElasticStack for years. I personally used Elasticsearch for more than 10 years and [Apache Solr](#) before for logging and observability usecases even before Elasticsearch's birth!

We also succeed to use ElasticStack for *IoT (Internet of Things)* projects and rebuilt our own images of Kibana and Elasticsearch for ARM32 and ARM64 before *Elastic* (the company) starts to release official images. We had a lot of fun with it.

Qu'est-ce que vector ?

Agent de collecte de logs et pipelines d'observabilité / ETL
Très rapide, écrit en Rust par datadog

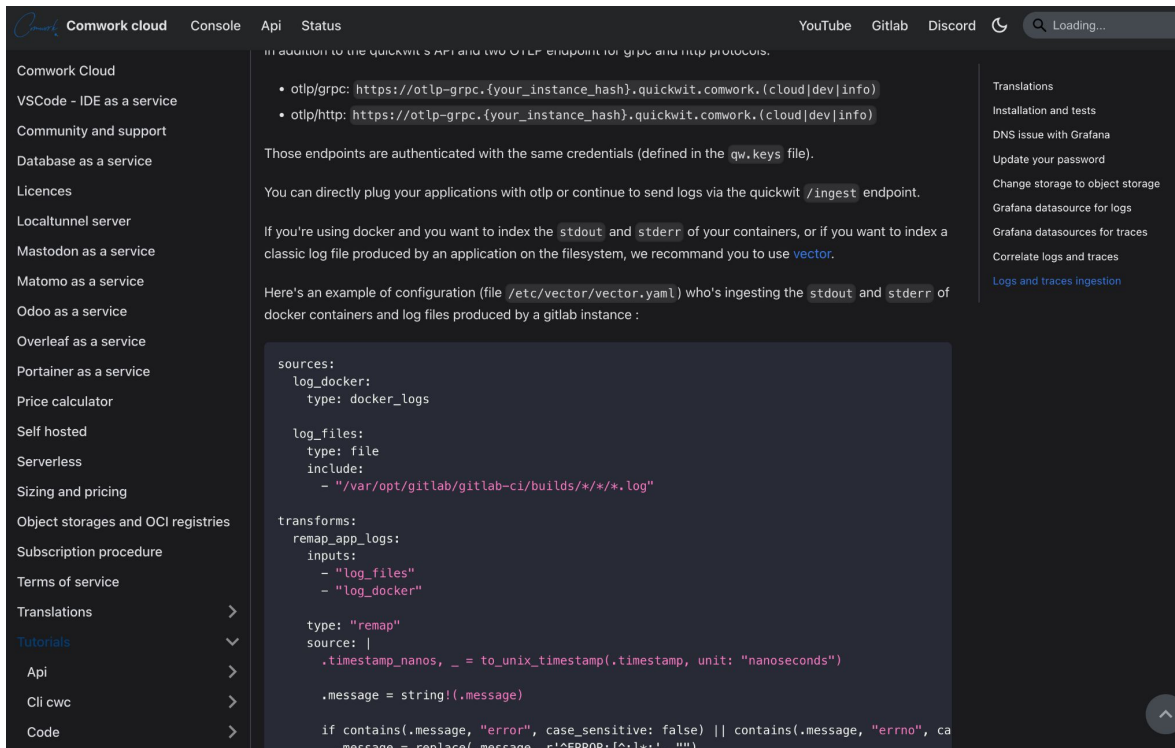

Site web : vector.dev

Comment utiliser Vector avec Quickwit ?

Tutoriel pour rendre les logs avec la définition de l'indexe otel-logs par défaut

Comwork Cloud Console

In addition to the Quickwit's API and the OTLP endpoint for gRPC and HTTP protocols:

- otlp/gRPC: `https://otlp-grpc.{your_instance_hash}.quickwit.comwork.{cloud|dev|info}`
- otlp/http: `https://otlp-grpc.{your_instance_hash}.quickwit.comwork.{cloud|dev|info}`

Those endpoints are authenticated with the same credentials (defined in the `qw.keys` file).

You can directly plug your applications with OTLP or continue to send logs via the Quickwit `/ingest` endpoint.

If you're using Docker and you want to index the `stdout` and `stderr` of your containers, or if you want to index a classic log file produced by an application on the filesystem, we recommend you to use **vector**.

Here's an example of configuration (file `/etc/vector/vector.yaml`) who's ingesting the `stdout` and `stderr` of Docker containers and log files produced by a GitLab instance :

```
sources:
  log_docker:
    type: docker_logs

  log_files:
    type: file
    include:
      - "/var/opt/gitlab/gitlab-ci/builds/*/*/*.log"

transforms:
  remap_app_logs:
    inputs:
      - "log_files"
      - "log_docker"

    type: "remap"
    source: |
      .timestamp_nanos, _ = to_unix_timestamp(timestamp, unit: "nanoseconds")

      .message = string!(.message)

      if contains(.message, "error", case_sensitive: false) || contains(.message, "errno", case_sensitive: false) {
        .message = replace(.message, r'^(ERROR|ERRNO):', '')
      }
```

Translations

- Installation and tests
- DNS issue with Grafana
- Update your password
- Change storage to object storage
- Grafana datasource for logs
- Grafana datasources for traces
- Correlate logs and traces
- Logs and traces ingestion
